Chapter 1

Complex Numbers

1.1 Basic Algebraic Properties

1. Verify that

(i) $(\sqrt{2}-i)-i(1-\sqrt{2}i) = -2i$; (ii) $(2-3i)(-2+i) = -1+8i$; (iii) $(3+i)(3-i)(\frac{1}{5}-\frac{1}{10}i) = 2+i$.

2. Find the complex numbers which are complex conjugates of

(i) Their own squares; (ii) Their own cubes.

3. Calculate the following quantities:

(i) $\frac{1+i \tan \theta}{1-i \tan \theta}$; (ii) $\frac{(1+2i)^3-(1-i)^3}{(3+2i)^3-(2+i)^2}$; (iii) $\frac{(1-i)^5-1}{(1+i)^5+1}$; (iv) $\frac{(1+i)^9}{(1-i)^7}$.

4. Find the points $z = x + iy$ such that

(i) $|z| \leq 2$; (ii) $\operatorname{Im} z > 0$; (iii) $\operatorname{Re} z \leq \frac{1}{2}$; (iv) $\operatorname{Re}(z^2) = a$; (v) $|z^2 - 1| = a$;
(vi) $\left| \frac{z-1}{z+1} \right| \leq 1$; (vii) $\left| \frac{z-\alpha}{z-\beta} \right| = 1$.

5. Derive the identity

$$\left(\frac{z_1}{z_3} \right) \left(\frac{z_2}{z_4} \right) = \frac{z_1 z_2}{z_3 z_4} \quad (z_3 \neq 0, z_4 \neq 0)$$

6. Using the above identity, derive the cancellation law

$$\frac{z_1 z}{z_2 z} = \frac{z_1}{z_2} \quad (z_2 \neq 0, z \neq 0)$$

1.3 Roots of a Complex Number

1. Find all the values of the following roots:

(i) $\sqrt[3]{1}$; (ii) $\sqrt[3]{i}$; (iii) $\sqrt[4]{-1}$; (iv) $\sqrt[6]{-8}$; (v) $\sqrt[8]{1}$; (vi) $\sqrt{3+4i}$; (vii) $\sqrt[3]{-2+2i}$; (viii) $\sqrt[5]{-4+3i}$;
 (ix) $\sqrt[6]{\frac{1-i}{\sqrt{3}+i}}$; (x) $\sqrt[8]{\frac{1+i}{\sqrt{3}-i}}$;

2. Prove that the sum of all the distinct n th roots of unity is zero. What geometric fact does this express?
3. Let ε be any n th root of unity other than 1. prove that

$$1 + 2\varepsilon + 3\varepsilon^2 + \dots + n\varepsilon^{n-1} = \frac{n}{\varepsilon - 1}$$

4. Prove that every complex number $\alpha \neq -1$ of unit modulus can be represented in the form

$$\alpha = \frac{1+it}{1-it},$$

where $t \in \mathbb{R}$.

1.4 Mash up

1. Express in the form $a + bi$:

(a) $\frac{1}{6+2i}$

(b) $\frac{(2+i)(3+2i)}{1-i}$

(c) $\left(-\frac{1}{2} + i\frac{\sqrt{3}}{2}\right)^4$

(d) $i^2, i^3, i^4, i^5, \dots$

2. Solve the equation $z^2 + \sqrt{32}iz - 6i = 0$
3. Suppose P is a polynomial with real coefficients. Show that $P(z) = 0$ iff $P(\bar{z}) = 0$ (i.e. zeroes of “real” polynomials come in conjugate pairs).

Chapter 2

Complex Functions

2.1 Limits and Continuity

1. Let $f : \Omega \subseteq \mathbb{C} \rightarrow \mathbb{C}$, $z_0 \in \Omega$. $\forall z \in \Omega$, prove that

$$(z \rightarrow z_0 \implies f(z) \rightarrow \infty) \iff (z \rightarrow z_0 \implies \psi(z) = \frac{1}{f(z)} \rightarrow 0)$$

2. The **Cauchy Convergence Criterion for sequences** states that a complex sequence z_n is convergent iff

$$\forall \varepsilon > 0 \exists N = N(\varepsilon) > 0 \forall m, n > N \\ |z_m - z_n| < \varepsilon.$$

Prove the generalization of the criterion: The function $f(z)$ approaches a limit as $z \rightarrow z_0$ iff

$$\forall \varepsilon > 0 \exists \delta = \delta(\varepsilon) > 0 \\ (0 < |z' - z_0| < \delta \wedge 0 < |z'' - z_0| < \delta) \implies |f(z') - f(z'')| < \varepsilon$$

3. Let $f(z)$ be a rational function, i.e., a ratio

$$f(z) = \frac{a_0 + a_1 z + \dots + a_m z^m}{b_0 + b_1 z + \dots + b_n z^n} \quad (a_m \neq 0, b_n \neq 0) \quad (2.1)$$

of two polynomials. Discuss the possible values of $\lim_{z \rightarrow \infty} f(z)$.

4. Where is the function Equation (2.1) continuous?

Chapter 3

Differentiation

3.1 Others

1. (a) Suppose $f(z)$ is real-valued and differentiable for all real z . Show that $f'(z)$ is also real-valued for real z .
(b) Suppose $f(z)$ is real-valued and differentiable for all imaginary points z . Show that $f'(z)$ is imaginary for all imaginary points z .

Chapter 4

Integration

Chapter 5

Singularities

Answers

Chapter 1

Basic Algebraic Properties

(Jump to: [Section 1.1](#))

- 1.
2. (a) $(0, 0), (1, 0), (-\frac{1}{2}, \pm\sqrt{\frac{3}{4}})$
(b) $(0, 0), (1, 0), (-1, 0), (0, i), (0, -i)$
3. (a) $(\cos \theta - i \sin \theta)^2$
(b)
(c) $\frac{9-40i}{41}$
(d) 2
4. (a) $\{(x, y) : x^2 + y^2 \leq 4\}$
(b) $\{(x, y) : y > 0\}$
(c) $\{(x, y) : x \leq \frac{1}{2}\}$
(d) $x^2 - y^2 = a$. Also, refer to this graph on Desmos: <https://www.desmos.com/calculator/buwtyobjrn>
